AutoApply Pro: Comprehensive Product Requirements Document (PRD)

Version: 1.1 | **Status:** Updated Draft | **Role:** Senior Product Manager

1. Executive Summary

AutoApply Pro is an AI-powered career coach and job search automation platform designed to simplify the job hunting process [cite: 59]. **The core concept of this project is to automate the cold emailing part of any job hunter's process.**

2. Target Audience & Problem Statement

Target Audience: Anyone who is actively searching for a job.

The Problem: Job seekers currently face "application fatigue"—the manual process of searching, tailoring resumes, and tracking statuses is slow, repetitive, and prone to human error [cite: 64].

The Solution: An intelligent agent that handles the "drudgery" (searching, drafting, applying) while allowing the candidate to focus on the high-value activity: interviewing [cite: 65].

3. Core Features Classification

Feature	Must-Have (MVP)	Nice-to-Have (V2+)
Automated Email Drafting	X	
Scheduled Email Sending	X	
PostgreSQL Database Tracking	X	
AI Resume Optimizer/ATS Checker		X
Multi-Profile Portfolio Management		X

Automated Job Scraping/Discovery		X
Mock Interview Platform		X

4. User Journey (End-to-End)

- **Onboarding:** User registers and creates a profile [cite: 70].
- **Asset Upload:** User uploads primary resume and defines preferences [cite: 71].
- **Job Pipeline:** System pulls relevant job opportunities into a "Review" queue [cite: 72].
- **Drafting & Review:** User reviews AI-generated draft emails for specific job listings and clicks "Approve" [cite: 73].
- **Outreach:** System automatically sends the email via SMTP and marks the application status as "Sent" in the database [cite: 74].
- **Tracking:** User views the dashboard to see which applications are "Pending" or "Rejected" and uses AI analytics to understand rejection trends [cite: 75, 76].

5. MVP Scope (Phase 1)

Goal: High-quality, personalized outreach, not broad-spectrum spam [cite: 78].

Functionality:

- User dashboard to manage manual job entries or imported CSV lists [cite: 80].
- Integration with Gemini/OpenAI API for personalization [cite: 81].
- Scheduled sending mechanism with SMTP and rate-limiting to protect sender reputation [cite: 82].

6. Success Metrics

- **Outreach Velocity:** Number of personalized applications sent per week per user [cite: 84].
- **Response Rate:** Percentage of applications that result in a recruiter response or interview request [cite: 85].
- **System Health:** Email deliverability rate (percentage of successfully sent emails without bounce-back) [cite: 86].
- **User Efficiency:** Time saved per application compared to manual processing [cite: 87].

7. Out of Scope (Deliberately NOT in V1)

- **Complex Job Scraping:** No automated web crawlers yet; users will add job opportunities manually to the database to ensure high-intent matching [cite: 89, 90].
- **Integrated Mock Interview AI:** Too complex for the initial phase; focus is purely on the application funnel [cite: 91].
- **Portfolio Presentation Webpage:** No public-facing candidate profile sites; focus remains on back-end outreach [cite: 92].
- **Market Insight Analytics:** No trending skill analysis yet; we are focused on execution rather than advisory [cite: 93].

> **PM Note:** By keeping V1 focused purely on the Outreach Engine, we establish the core value proposition (getting more interviews) before adding the secondary features (coaching, optimization, market data) [cite: 94].
